PREFACE

APEC Energy Statistics 2003 consists of the following three chapters;

1. Explanation of the APEC Energy Statistics
2. Overview of the APEC Energy Situation
3. Member Tables

The statistics cover APEC member economies, i.e. Australia; Brunei Darussalam; Canada; Chile; People's Republic of China; Hong Kong, China; Indonesia; Japan; Republic of Korea; Malaysia; Mexico; New Zealand; Papua New Guinea; Peru; Republic of the Philippines; the Russian Federation; Singapore; Chinese Taipei; Thailand; the United States of America and Viet Nam.

Chapter 1 describes the methodology for collecting and standardizing the energy data and for producing the secondary data such as an energy balance. Preparations of social-economic data are also explained.

Chapter 2 provides an analysis of energy demand and supply in the APEC region and contains figures and tables showing trend of energy demand and supply.

Chapter 3 consists annual tables and quarterly tables by the member economies. The annual tables contain Energy Balance Tables for 2003 and 2002, Original Tables of Energy Demand and Supply, Final Energy Demand by Disaggregated Sectors and Energy Price for 2003. The annual tables also involve Major Energy Indicators which include primary energy supply, final energy consumption, demand and supply by energy sources and electricity as well as Major Economic Indicators which include population, GDP, balance of payments, foreign exchange rate, purchasing power parity, price indices and so on. These tables cover the data for 1980-2003 historically except Russia and Viet Nam due to data availability. The quarterly tables contain only original data of energy demand and supply. The objective is to report the most recently updated data.

APEC Energy Statistics 2003 is derived from the APEC Energy Database, the purpose of which is to establish a comprehensive and consistent energy database within the APEC region. This database will be used to assist in the identification of significant trends in energy supply and demand consistent with projects and priorities under the APEC Energy Working Group. It is prepared in close cooperation with member economies.

Inquiries about data should be addressed to The Energy Data and Modelling Center, The Institute of Energy Economics, Japan.

APPENDIX	343

1 Explanation of the APEC Energy Statistics

The APEC Energy Statistics consist of energy data submitted by each member economy as well as social-economic data collected by EDMC (The Energy Data and Modelling Center), which is the Coordinating Agency (here in after refer to C.A.) for this APEC activity. The energy-balance tables, which give a detailed description of all energies, and other tables (primary energy supply, final energy consumption, etc.) included in the statistics are secondary data compiled by EDMC.

1.1 Energy Data

1.1.1 Original Data

The APEC member economies regularly submit energy demand and supply data to EDMC. These data are defined as “original data”. Details for collection of the data are given below:

a. Collection Format for Original Energy Data

Each item found in the Energy Statistics is based on data submitted by the APEC member economies using a specified format (APEC Energy Data Reporting Format). To facilitate data input, the format is based on the ASEAN format that AEEMTRC used to collect energy data from ASEAN countries. After release of the initial test version in 1991, followed by two revisions, standard data collection began in 1994 using the format seen in the Appendix. The ASEAN countries, however, continue to use the ASEAN format to avoid redundancy.

Using this format, the members report the following information:

- Supply and demand information for specific commercial energy (Refer to the Appendix)
- Power generating capacity by type
- Supply and demand information for non-commercial energy

The commercial energy supply and demand data by sector and by energy in the format as shown in Table 1-1, are reported by the members in terms of physical quantity, conversion factor and thermal quantity. There is no single standard unit for thermal quantity, and the data are

reported in the original units used by each member economy as follows:

- Joules
Australia; Canada; Chile; Hong Kong, China; Mexico; New Zealand and Papua New Guinea.
- Calories
Japan and Chinese Taipei
- Tons of Oil Equivalent (TOE)
Brunei Darussalam; Indonesia; the Republic of Korea; Malaysia; Peru; the Philippines; Singapore; Thailand and Viet Nam
- Tons of Coal Equivalent (TCE)
People's Republic of China and Russian Federation
- British Thermal Unit (BTU)
United States of America

With regard to thermal quantity, the members reported either the gross calorific value or the net calorific value.

In principle, the power capacity for thermal, hydro, nuclear and other power are reported as at the end of the year.

In the questionnaire outlining primary energy supply, transformations and final energy consumption in member economies, spaces are provided for the amounts of non-commercial energy (i.e. bagasse and firewood) consumed. Except for Korea, Thailand and Peru, most members have left these spaces blank.

The format is prepared in Excel and is sent regularly to each member as a spreadsheet file. The members enter their data and return them to C.A. From the submission, C.A. compiles the statistical tables as shown in section 3, yielding the table of original data (after adjustment), energy balance table and other tables.

C.A. changed the format for collection from 1998 energy data as follows:

- A few energy items are added in the collection format for annual energy demand and supply data (Refer to Table 1-1).
- Sections for disaggregated energy demand data

(Table 1-2) and for energy price data (Table 1-3) were newly added.

- Collection format for quarterly energy data was simplified.

C.A. changed the format for collection from 2000 energy data added Coal, Oil, Gas item breakdown of Thermal Power.

Table 1-1 Energy and Sector Name of the APEC Energy Data Reporting Format Table 1

Energy Name	Sector Name
Coal	Primary Energy Supply
Hard Coal	Indigenous Production
Steam Coal	Opening Stocks
Coking Coal	Closing Stocks
Subbituminous Coal	Stock Change
Anthracite	Imports
Lignite	Exports
Coal Products	International Marine Bunkers
Coke	Total Primary Energy Supply
Coke Oven Gas	Transformation Sector (Input)
Briquettes	Coal Transformation
Blast Furnace Gas	Refining
Others	Gas Processing
Crude Oil and NGL/Condensate	Power Generation (Public Utilities)
Crude Oil	Power Generation (Auto Producers)
NGL/Condensate	Transformation Sector (Output)
Petroleum Products	Coal Transformation
Refinery Gas	Gas Recovering
LPG	Refining
Naphtha	Gas Processing
Mogas	Power Generation (Public Utilities)
Jet Fuel	Power Generation (Auto Producers)
ATF/AVGAS	Transformation Sector (Loss and Own Use)
Kerosene	Final Energy Consumption Total
Diesel Oil	Agriculture
Fuel Oil	Residential & Commercial
Other Petroleum Products	Others
Gas	Industry
Natural Gas	Transport
LNG	Non-Energy Use
Town Gas	
Electricity	
Thermal Power	ELECTRICITY GENERATING CAPACITY TABLE
Coal	Thermal Power
Oil	Coal
Gas	Oil
Hydro Power	Gas
Nuclear Power	Hydro Power
Geothermal	Nuclear Power
Wind	Geothermal Power
Tide	Others (Wind, Tide, Photovoltaic)
Photovoltaic Power	Others (Biomass, Municipal Waste)
Other Power	Cogeneration
Heat	Coal
Geothermal Heat	Oil
Solar Heat	Gas
Others	Others (Biomass, Municipal Waste)

b. Collection Schedule

The schedule for the 2003/2004 standard run is shown below.

Table 1-4 Schedule for the 2003/2004 Standard Run

Energy Data	Format Distribution	Format Deadline
1 st Quarter, 2004	-	31 July 2004
2 nd Quarter, 2004	-	31 Oct. 2004
3 rd Quarter, 2004	-	31 Jan. 2005
4 th Quarter, 2004	-	30 Apr. 2005
2003 Annual	20 Sept. 2004	30 Nov. 2004

In principle, all twenty-one APEC members are expected to send one yearly and four quarterly data files to EDMC.

Except for Australia, yearly data submitted by member economies are for the calendar year. The data from Australia are for their fiscal year, July to June.

The purpose of the quarterly data is to report the most recently updated data.

c. Collection Status

20 member economies submitted 2003 annual energy demand-supply data to C.A. But some member economies were not able to submit disaggregated final

energy demand data and energy price data. Mexico did not submit annual data for 2003. C.A. downloaded Mexico energy balance tables from Mexico Website and fill the data in APEC reporting format.

The simplified format for collecting quarterly data has increased the response rate of members and improved the quality of the data. So far fourteen member economies already submitted all quarterly data for 2003 to C.A.

For Papua New Guinea, C.A. produced the original tables and energy balance tables for 1994-2003 using several energy data submitted by Papua New Guinea's government. The energy balance tables for 1980-1993 are based on the UN (United Nations) "Energy Statistics Yearbook".

d. Use of the Internet

The original data are collected using Excel format and exchanged via the Internet. Although in most cases the files could be attached to e-mail, C.A. had to rely FTP (File Transfer Protocol) for some members due to incompatibility in E-mail software. But from 1998/99 standard run, E-mail exchange is available on all member

economies except Papua New Guinea.

1.1.2 Standardization

As observed, the data submitted are not standardized in terms of heat conversion as well as in physical value. C.A. adjusts the figures to allow comparisons between members. The adjustments are shown below.

a. Conversion Factors for Fossil Energy

Between the two calorific values, namely gross and net calorific values, the APEC Standard adopted the net calorific value at the Third Experts Meeting (Singapore) to facilitate comparisons with international energy statistics such as IEA (International Energy Agency) and UN. Therefore, the data shown in gross calorific value used by some members must be converted to net calorific value. According to C.A. study, following members report their energy data in net calorific value: Canada, Korea, Malaysia, Mexico, Chinese Taipei and Thailand. The remaining fourteen members follow these procedures when converting gross into net calorific value.

Coal / Oil multiply the value by 95%

Gas multiply the value by 90%

The value New Zealand used under Specific Unit Value was in TOE (Tons of Oil Equivalent) from 1975 to 1996. After confirming with New Zealand that the value represents gross calorific value, it was converted into net calorific value. From 1997 New Zealand reports both gross calorific value and net calorific value and changed the unit to joules. C.A. used the gross calorific value and converted the data to net calorific value for making energy balance tables.

b. Conversion Factors for Primary Electricity

Table 1-5 shows the efficiency of primary electricity, i.e. power generated by processes which excludes fossil fuel, such as hydro, nuclear, geothermal and other power generation. To allow comparisons of primary energy supplies, in light of differences in conversion coefficients,

standardization was required. APEC adopted the following conversion coefficients for compatibility with IEA and UN statistics.

Table 1-5 Efficiency of Primary Electricity

Primary Electricity	Efficiency
Hydro Power	100%
Nuclear Power	33%
Geothermal Power	10%
Other New Power	100%

The original energy data contained in these statistics have been treated by the above adjustments.

1.1.3 Secondary Data

Using the original data submitted by each member, C.A. prepares the following tables through the standardization process described in 1.1.2.

- (1) Energy Balance Table *
- (2) Primary Energy Supply Table
- (3) Final Energy Consumption Table
- (4) Supply and Demand by Energy Source Table
- (5) Electricity Table
- (6) Stock Change Table

* The Energy Balance Tables give a detailed description of energy sources.

APEC Energy Statistics contain the above six tables, together with a table of original data after standardization as described in 1.1.2. Tables (2) through (6) are collectively referred to as "other tables", and are compiled from data obtained from the table of original data after adjustment and the energy balance table. The five tables from (2) through (6) allow comparisons among member economies.

a. Energy Balance

The energy balance table is, in principle, the same as that of the IEA, but with some adjustment (see 1.1.2). The different value could be accounted for by following:

- APEC statistics are basically based on official data provided by national government agencies of each

member economy, and, thus, agencies exclude any data not reported to the government. It is assumed that the

IEA estimates these quantities.

Table 1-6 Heat Efficiency for Primary Electricity of each Member Economy (unit: %)

Economy	Hydro	Nuclear	Geothermal	Other
Australia	100	-	-	100 ^(*)1)
Brunei Darussalam	-	-	-	-
Canada	100	106	-	-
Chile	100	-	-	-
People's Republic of China	100	100	-	-
Hong Kong, China	-	-	-	-
Indonesia	100	-	100	-
Japan	38.1	38.1	38.1	38.1 ^(*)2)
Republic of Korea	100	33.0	-	-
Malaysia	100	-	-	-
Mexico	100	33.3	10	100 ^(*)3)
New Zealand	100	-	10	-
Papua New Guinea	100	-	-	100 ^(*)3)
Peru	80.0	-	-	-
Philippines	100	-	100	-
Russian Federation	35.8	35.8	35.8	-
Singapore	-	-	-	-
Chinese Taipei	100	33.0	-	-
Thailand	38.5	-	9	-
United States of America	33.0	31.8	16.3	33.0 ^(*)4)
Viet Nam	27.1	-	-	-

Note 1)

"-" means the item in the report was left blank, due possibly to irrelevance of the said facility to the member.

Note 2)

*¹: Photovoltaic Power

*²: Power from garbage incineration, black liquor recovery, furnace ash, and solar energy.

*³, *⁴: Wind or solar power

- For this reason, some data for private-power generations are missing in some member economies.
- APEC and the IEA use different heat conversion methods.
- The reporting date differs in APEC and IEA surveys.

The major difference between the two formats is that in the APEC energy balance table, "Industry" and "Transport" are treated as one item.

The APEC energy balance table consists of two tables, quoted in calories and in joules.

b. Other Tables

Other tables, i.e., primary energy supply, final energy

consumption, supply and demand by energy source, electricity and stock change, are all designed to allow comparisons among members.

The primary energy supply table shows items that constitute the primary energy supply, namely, indigenous production, imports, exports, stock change, and international marine bunkers in terms of calorific values (calories and joules), for each of the four categories of coal, petroleum, gas, and primary electricity (hydro, nuclear, geothermal power, etc.).

The final consumption table illustrates the consumption of coal (including coal products), petroleum, gas, electricity and others for each final consumption sector (agriculture, residential, commercial, industry and

transport).

The supply and demand table for each energy source emphasizes coal, petroleum and gas, and shows, at a balance, how the primary supply volume is being consumed in the transformation and final energy consumption sectors.

The electricity table illustrates the power generation and fossil fuel input for each of the five categories of thermal, hydro, nuclear, geothermal and other sources of power generation.

The stock change table shows the inventory of fossil fuels owned by each member economy, in units of calorific value (calories and joules), at the beginning and end of the period as well as the stock change. Since the conventional approach is to report stock level only in terms of its change, many members omit the stock level at the beginning and end of the term.

1.2 Notes of Member Economies

General Notes

Most of the member economies' annual data are tallied by calendar year (1 January – 31 December) except for Australia; Australia's energy statistics are accounted by fiscal year (1 July-30 June).

Australia

In the statistics, non-commercial energy data are shown independently and not incorporated into the energy balance table. For Australia, where non-commercial energy such as bagasse and sugarcane are generally treated as commercial energy, it is shown under Other Commercial Energy.

Indonesia

Indonesia reported thermal power output in the space that should show fuel consumption for thermal power generation from 1980 to 1994. C.A. estimates Indonesian fuel consumption as follows:

Based on the thermal power generation efficiency from 1980 found in the ASEAN Energy Review

(prepared by AEEMTRC), C.A. estimates average power generation efficiency to date (approx. 30%). Using this value together with the power output and the heat conversion rate for various fuels the following estimate is obtained:

$$F_j = (PG_j \times 860) \div EF \div CF_j$$

F_j : amount of fossil fuel j consumed for power generation (kL, kg, cf)

PG_j : amount of power output from fossil fuel j (kWh)

860: heat conversion rate of electricity (kcal/kWh)

EF : average power output efficiency (30%)

CF_j : heat conversion value of fossil fuel j (kcal/kL, kg, cf)

The Indonesian government has approved this process.

From 1995 Indonesia reported all fuel consumption for thermal power include public utility and private utility.

Power generation by captive power is included in the total electricity generation starting after 1995 and C.A. estimates the generation figures after 2001 based on other sources.

Japan

Energy data after 2000 are not official data prepared by Japanese Government. CA used data on energy balance table produced by the Institute of Energy Economics, Japan to maintain continuity of data before 2000.

New Zealand

New Zealand reported figures in TOE (Tons of Oil Equivalent) until 1997, which shows gross calorific value, in the space for specific unit value, and uses Joules as the unit of calorific value. Although this poses no problem in compilation, the reader cannot determine the physical quantity of each energy source. To solve this problem, the heat conversion coefficient for each energy source is shown on the APEC Energy Database web page (<http://www.ieej.or.jp/egeda/>). The government of New Zealand provided the information.

Papua New Guinea

CA estimated energy balance tables from 2000 to 2003 for Papua New Guinea.

Singapore

Singapore cannot submit the data of natural gas imports and the data of crude oil into refinery sector and the data of petroleum products in refinery output and public utilities. Furthermore there are no data in final energy consumption sectors.

CA estimated energy balance tables for Singapore from 1980 to 2003.

3 issues are in Singapore's data.

- Data in the Final Energy Consumption Sector are incomplete.

- Petroleum Refinery input (Crude Oil, etc.) and output (Petroleum Products) are not submitted.

- In some items, the data contain errors.

C.A. estimated values in petroleum refinery using import volumes of crude oil and export volumes of petroleum products (assuming the stock change and the discrepancy are 0).

Some erroneous data are corrected by using other sources, data from Energy Market Authority in Singapore, and the social and economic indicators (ex: GDP etc.).

Thailand

As will be noted, Thailand uses net calorific value for conversion into toe (Tons of Oil Equivalent) as follows;

$$1 \text{ toe} = 10.093 \text{ Gcal} = 1.0093 \times 10^7 \text{ kcal}$$

One TOE normally equals 1×10^7 kcal, which means that Thailand's calorific value indicates is slightly lower than the normal figure.

C.A. has converted Thailand's calorific value for 1980-2002 according the definition of APEC Energy Statistics as below:

$$1 \text{ toe} = 10^7 \text{ kcal}$$

Regarding electricity, C.A. converts the value using;

$$1 \text{ kWh} = 860 \text{ kcal} = 0.000086 \text{ TOE.}$$

United States of America

For 2003, United States submitted the energy data in IEA format.

Because of differences in definition of IEA and APEC, some of the data for 2003 are quietly deferent to the data from 1980 to 2002.

APEC data definition is different from IEA definition especially in the Coal Transformation flow. In this regard, CA adjusted the Coal Transformation data to fit the APEC definition to ensure consistency of the data series.

Others

- The member economies in the ASEAN place the transformation of natural gas to LNG under "Gas Processing" in the sector on transformation. However, three member economies, Japan, Korea and Chinese Taipei, use this item to show the input and output for town gas production. Thus, for ASEAN countries, natural gas can be understood as input and LNG as output.

- In case of the United States of America, power generation of auto producers has appeared from 1991.

1.3 Social-Economic Data

At the moment, the social-economic data for each member economy shown in the APEC Energy Statistics are not reported by the members, but, instead, are prepared by C.A. The data are derived from the "World Development Indicators" (World Bank) and "The International Financial Statistics Yearbook" (IMF). The data on Chinese Taipei not found in these statistics, are derived from the "Chinese Taipei Statistical Data Book". This book was regularly delivered to C.A. through the goodwill of this member. The items C.A. picks up from these statistics are:

- Population
- GDP and its components
- Index of Industrial Production
- External Trade (dollar base)
- Balance of Payment (dollar base)

- Exchange Rate
- Prices (CPI, etc.)

The GDP data of Brunei from 1996 are also derived from the “Brunei Darussalam Statistical Yearbook”.

In addition to reporting the GDP in the member economy’s currency, C.A. provides estimates in real, nominal dollar and real PPP (Purchasing Power Parity) terms.

1.4 APEC Energy Database

C.A. has established the APEC Energy Database, which contains all data on APEC Energy Statistics. The address of APEC Energy Database is:

<http://www.ieej.or.jp/egeda/>

2 Overview of the APEC Energy Situation

2.1 Overall Notes

Chapter 2 summarizes the energy supply and demand in the APEC region using the energy balance tables of APEC member economies stored in the APEC Energy Database. Energy categories used in this chapter are defined as follows:

a. Coal:

Hard coal, anthracite and lignite
Coke, coke oven gas, blast furnace gas, briquette and other coal products

b. Oil:

Crude oil, NGL, and other refinery intakes
MOGAS, naphtha, diesel oil, jet fuel (includes AVGAS), kerosene, fuel oil, LPG and other petroleum products

c. Gas:

Natural gas, LNG and town gas

d. Hydro, Nuclear, etc.:

Electricity generated from non-thermal resources such as hydro, nuclear, geothermal, solar and wind

e. Others:

Incineration and commercial renewable energy

Regional groupings of APEC member economies are as follows:

a. East Asia:

China; Hong Kong, China; Japan; Korea and Chinese Taipei

b. Southeast Asia

Brunei Darussalam, Indonesia, Malaysia, Philippines, Singapore and Thailand

c. Oceania:

Australia, New Zealand and Papua New Guinea

d. North America:

Canada and United States of America

e. Latin America:

Chile, Mexico and Peru

At this stage, Russia and Viet Nam are not included in the above categories, due primarily to the unavailability of historic time series data. However, data for 2003 are

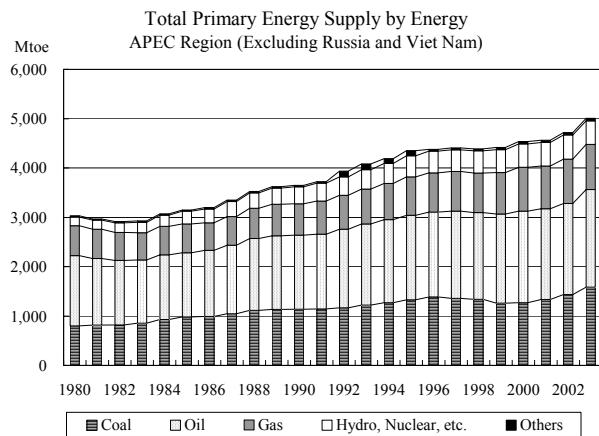

available for these two economies.

2.2 Analysis of Energy Supply and Demand in the APEC Region

This section discusses energy supply and demand in the APEC region.

2.2.1 Primary Energy Supply

The level of primary energy supply in 2003 of 5,006 Mtoe was 6.1% up from the 2002 level of 4,719 Mtoe, a rebound after the sixth year of a financial and economic crisis in Asia. In the period from 1980 to 2003, primary energy supply averaged 2.2% growth per annum, in contrast with 3.3% growth in real GDP over the same period. As a result, elasticity of demand was calculated at 0.67 for this period.

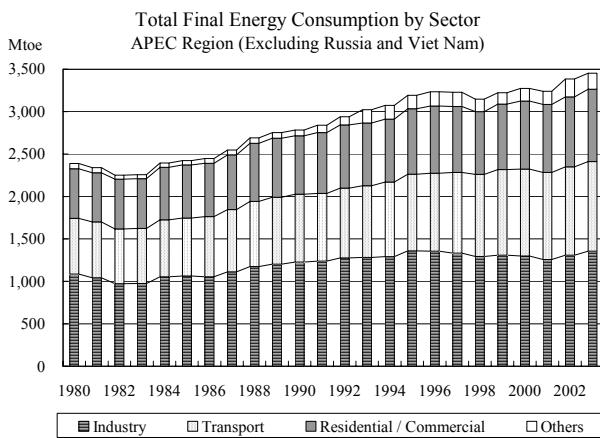

For the period 1980 to 2003, coal supply rose by an average of 3.0% per annum to reach 1,586 Mtoe in 2003. Oil supply rose by an average of 1.4% per annum to reach 1,981 Mtoe in 2003. Gas supply increased 1.8% per annum to reach 912 Mtoe. The supply of hydro, nuclear, etc. grew by 4.5% per annum to reach 475 Mtoe. The category of “Other” grew 3.2% per annum, the total was small as 52 Mtoe and the share was only 1.0% in 2003.

2.2.2 Final Energy Consumption

The level of final energy consumption in 2003 of 3,453 Mtoe was 2.0% up from the 2002 level of 3,384 Mtoe, grew 1.6% per annum from 2,388 Mtoe in 1980.

This growth rate for 23 years was lower than that of primary energy supply. It indicates that net energy consumption growth in the transformation sector surpassed the final energy consumption sector.

The residential/commercial sector grew by 3.6%, from 823 Mtoe in 2002 to 853 Mtoe in 2003. The transport sector grew by 1.4% from 1,041 Mtoe in 2002 to 1,056 Mtoe in 2003. Consumption in the industrial sector grew slowly (1.0% per annum from 1980 to 2003) and grew 3.6% from 2002 to 2003, the total of 1,356 Mtoe was the largest for all sectors in 2003. The industry sector share of the total was 39.3%, the transportation sector share 30.6%, and the residential/commercial sector share 24.7%.

By energy source, oil consumption grew by 1.2% from 1,678 Mtoe in 2002 to 1,697 Mtoe in 2003, averaging 1.5% per annum from 1,212 Mtoe in 1980.

Electricity consumption rose by 5.4% from 637 Mtoe in 2002 to 672 Mtoe in 2003. Gas consumption increased by 0.3% from 566 Mtoe in 2002 to 568 Mtoe in 2003. Coal consumption grew by 2.2% from 433 Mtoe in 2002 to 443 Mtoe in 2003.

2.2.3 Energy Balance Table

This section presents the 2003 aggregate energy balance table for the APEC region. Note that the table includes data for 19 member economies. The export/import: row does not show the volume of trade between APEC and non-APEC regions.

Some of the salient features from the table are:

- 70% of coal is used for power generation.
- Petroleum products consumed by APEC members are mainly refined within the region.
- The percentage share of gas consumption is third, behind petroleum products and electricity. The industrial, and residential/commercial sectors are the dominant users.
- The category “Other” consists mainly of wastes and commercial renewable energy, such resources being used to generate electricity and consumed directly in the industry sector and the residential/commercial sector.

APEC Region (Excluding Russia and Viet Nam) 2003													Unit: Mtoe	
	1 Coal	2 Coal Products	3 Crude Oil, NGL and Condensate	4 Petroleum Products	5 Gas	6 Town Gas	7 Hydro	8 Nuclear	9 Geothermal, Solar, etc.	10 Others	11 Electricity	12 Heat	13 Total

18 Non-energy	6	6	3	36	18	-	-	-	-	2	-	-	69	

- Recovery of heat created during power generation (co-generation) accounts for 1.0% of final energy consumption.
- Oil accounted for approximately half of total final energy consumption, followed in order, by electricity, gas, and coal.

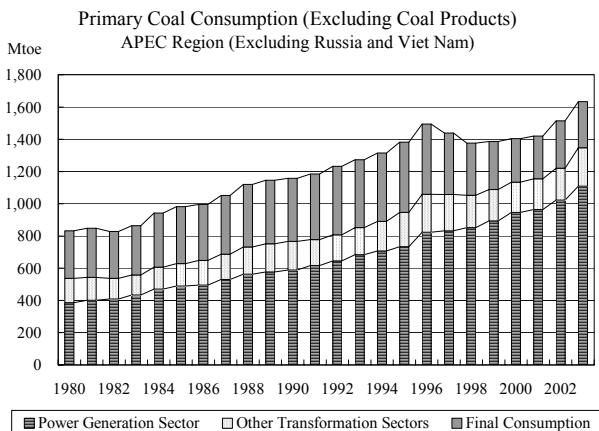

2.3 Analysis of Energy Supply and Demand by Energy Sources

This section analyses energy supply and demand in the APEC region by energy sources.

2.3.1 Coal (excluding coal products)

The supply of coal increased by 10.3% in 2003 over the year before (from 1,447 Mtoe in 2002 to 1,595 Mtoe in 2003). The coal share in the total primary energy supply increased until 1985, and remained around 30% thereafter.

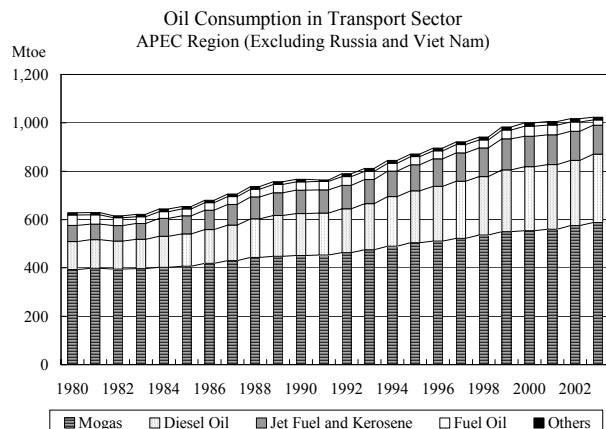

Most coal (excluding coal products) is used for electricity generation, accounting for 67.9% of the total supply in 2003.

2.3.2 Oil

Oil supply increased by 7.6% from 1,842 Mtoe in 2002 to 1,981 Mtoe in 2003. Oil represented 39.6% of total primary energy supply in 2003.

More than half of all petroleum products are used in the transportation sector, with the major products being automotive gasoline and diesel oil. Recently, there has been a marked increase in the consumption of diesel.

2.3.3 Gas

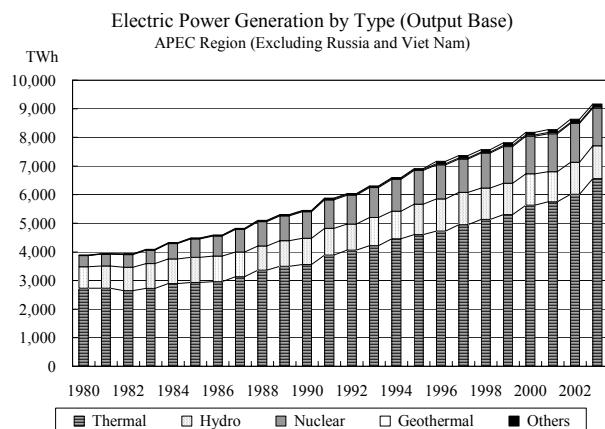

The supply of gas increased by 1.3%, from 900 Mtoe in 2002 to 912 Mtoe in 2003. Natural gas represented 18.2% of total primary energy supply in 2003.

Most gas is consumed in the industrial and residential/commercial sectors. As of 2003, 30.2% of gas was used for electric power generation.

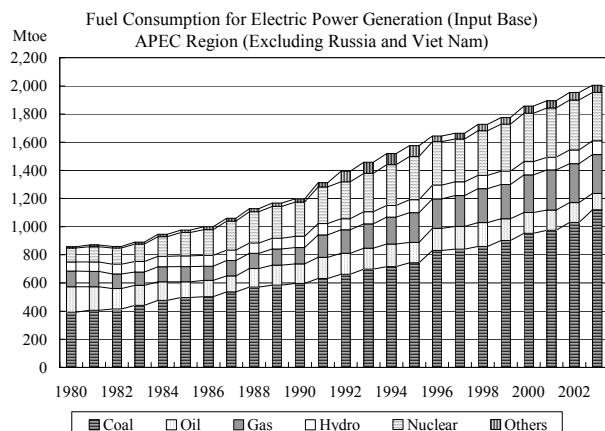

2.3.4 Electricity

The supply of hydro, nuclear, etc. decreased by 3.2%, from 491 Mtoe in 2002 to 475 Mtoe in 2003. From 1980 until 2003, the supply of hydro, nuclear, etc. grew 4.5% per annum.

Power generation rose by 6.2% from 8,632 TWh in 2002 to 9,168 TWh in 2003. From 1980 until 2003, power generation grew 3.8% per annum (from 3,885 TWh). Thermal power generation grew 9.2%, from 6,010 TWh in 2002 to 6,561 TWh in 2003. As a result, the share of thermal power generation was 71.6% of the total in 2003. Nuclear power generation decreased by 2.6%, from 1,350 TWh in 2002 to 1,316 TWh in 2003. The hydropower generation rose by 1.3% from 1,127 TWh in 2002 to 1,142 TWh in 2003.

When discussing the issue of global warming in the APEC region, there is significant room for exploring possible solutions, including improving the efficiency of coal-fired power generation units, and converting from coal and oil to gas-fired generation.

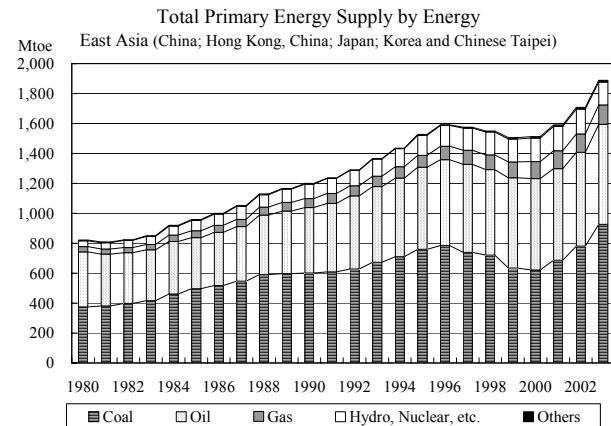

2.4 Analysis of Energy Supply and Demand by Region

2.4.1 East Asia

This section divides the APEC region into five groups, namely East Asia, Southeast Asia, Oceania, North America and Latin America, to compare their energy supply and demand situations.

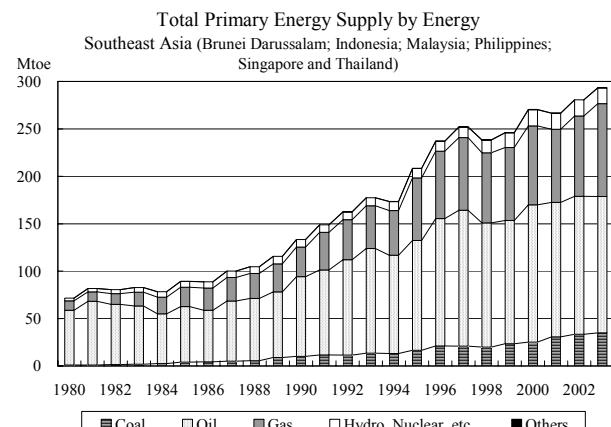

East Asia, accounting for 49.0% and 35.5% of total energy supply, respectively, in 2003.

In terms of final energy consumption by sector, the industrial sector has the highest consumption, followed in order by the residential/commercial sector and the transportation sector. 52.9% of final energy was consumed in the industrial sector.

2.4.2 Southeast Asia

Primary energy supply in Southeast Asia rose by 4.5% to 293 Mtoe in 2003 and from 1980 to 2003 it increased 6.3% per annum; the highest rate of growth of the five regional groups, and the share of the total APEC region was 5.9% comparing with 2.4% in 1980.

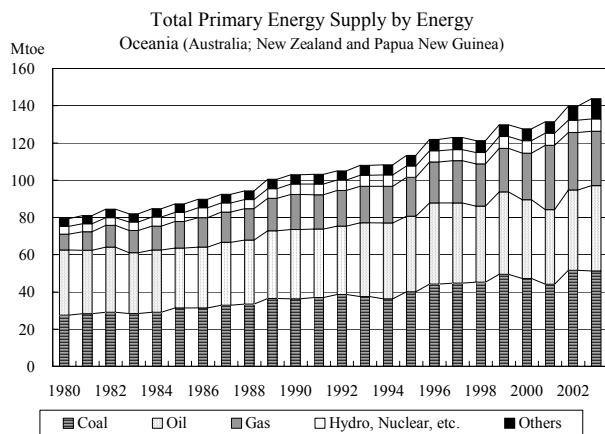

Although Southeast Asia relies heavily on oil, use of coal and gas has been increasing in recent years. Therefore the share of oil has dropped to 49.0% from 81.0% in 1980.

The transportation sector consumes the largest amount of energy, followed in order by the industrial and

residential/commercial sectors. Because most energy demand in the transportation sector is met by oil, consumption of this fuel has grown steadily.

2.4.3 Oceania

Primary energy supply in Oceania increased by 2.9% to 144 Mtoe in 2003. From 1980 to 2003, the average growth rate per annum was 2.6% (from 79 Mtoe). The Oceania share of total APEC supply was only 2.9% in 2003.

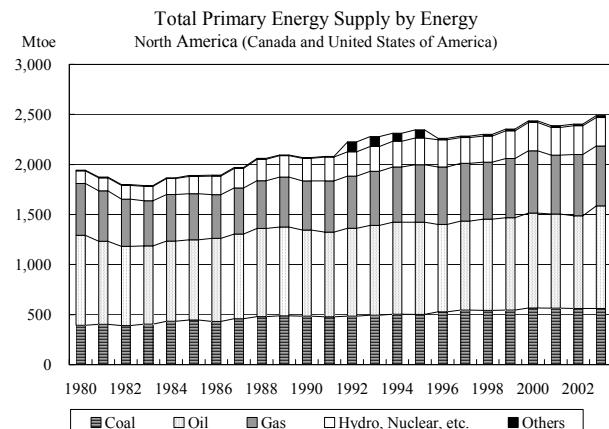

Coal and oil are the major energy sources in Oceania, accounting for 67.6% of total primary energy supply. Oil supply increased by 6.3% though gas supply decreased by 5.0% in 2003.

In terms of final energy consumption by sector, the transport sector consumed the highest amount of energy, followed in order by the industrial sector, and the residential/commercial sector.

2.4.4 North America

Primary energy supply in North America increased by 3.5% to 2,488 Mtoe in 2003, or 1.1% per annum from 1,943 Mtoe in 1980. The area accounted for the greatest share of energy supply in the APEC region (e.g. 49.8% in 2003). Discontinuity between 1992 and 1995 is due to data availability of autoproducers of electricity in the United States of America.

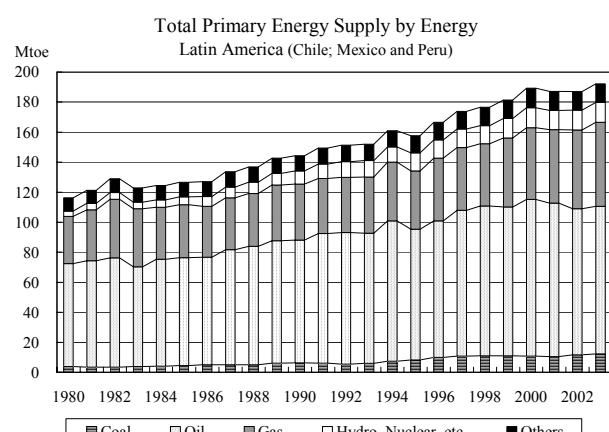

The main energy source in North America is oil, although supply has remained more or less stable over the past 23 years. Supply of coal and gas has increased modestly over the same period.

In terms of final energy consumption by sector, energy consumption by the industrial and transportation sectors is comparable, 31.1% and 38.8% of the total, respectively. The residential/commercial sector consumed 29.1% of the total.

2.4.5 Latin America

Primary energy supply in Latin America grew by 2.7% to 192 Mtoe in 2003, increased 2.2% per annum from 116 Mtoe in 1980. Imports of natural gas via pipeline to Chile began in 1999, and this boosted overall growth.

Oil is the major energy source in Latin America and represented 51.2% of the total, followed by gas with a share of 29.1% in 2003.

In terms of final energy consumption by sector, the

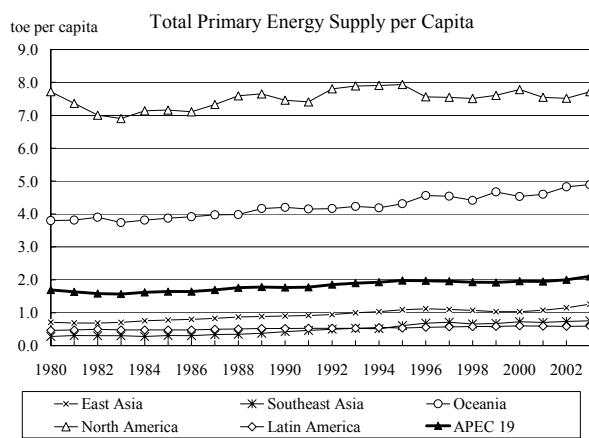

transport and industrial sectors consumed 39.8% and 29.3% of the total, respectively, in 2003.

2.5 Other Analyses

This section analyses per capita primary energy consumption, the elasticity of primary energy supply against real GDP and CO₂ Emissions in the region.

2.5.1 Primary Energy Supply Per Capita

North America had the highest primary energy supply (7.72 toe per capita) in the APEC region in 2003, followed in order by Oceania (4.89 toe), East Asia (1.26 toe), Southeast Asia (0.76 toe) and Latin America (0.60 toe). The average for APEC excluding Russia and Viet Nam came to 2.11 toe per capita in 2003.

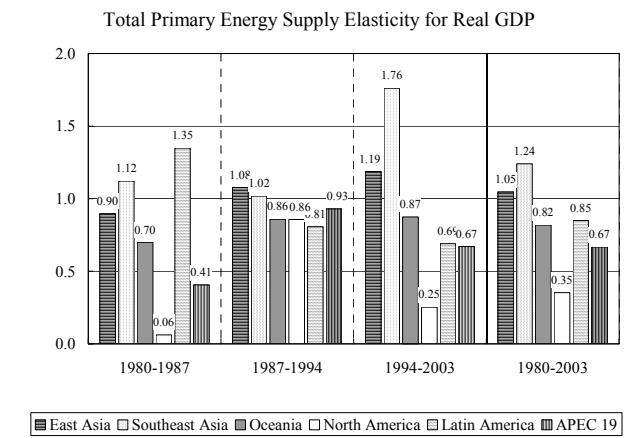

From 1980 until 2003, the APEC average growth rate in energy per capita was 0.9% per annum (from 1.70 toe per capita). While in Southeast Asia, the growth rate was 4.5% per annum for the last 23 years. North America showed almost no growth (0.0%) over this period. Although East Asia experienced strong growth until the mid-1990's, there was a recorded drop for three consecutive years from 1997 to 1999.

2.5.2 Elasticity of Primary Energy Supply against Real GDP

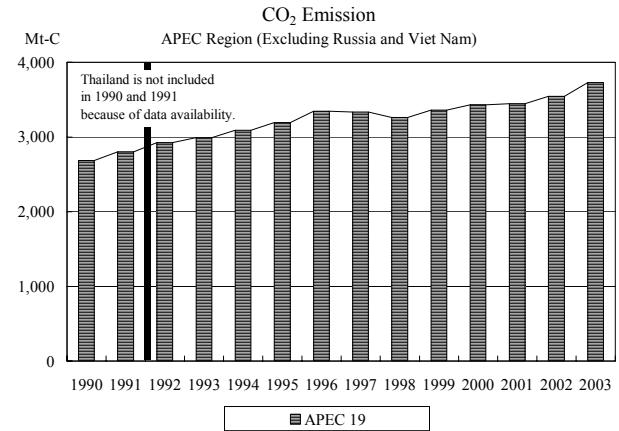

From 1980 until 2003, the elasticity of supply has exceeded 1.0 in Southeast Asia (1.24) and East Asia (1.05) over the last 23 years. The converse is true for Oceania (0.82), North America (0.35, the lowest) and

Latin America (0.85). Elasticity for the APEC region as a whole was 0.67. This means that when the GDP of the APEC region increased by one unit, energy supply increased 0.67 units.

2.5.3 CO₂ Emissions from Fuel Combustion

The data of CO₂ emission data for 2003 were collected from 7 member economies, which are Australia; Canada; Hong Kong, China; Japan; New Zealand; Chinese Taipei; Thailand and United States. For the other member economies, the Coordinating Agency (The Energy Data and Modelling Center) estimated their CO₂ emissions data. Based on both of the data above mentioned, CO₂ emissions from fuel combustion grew by 5.2% from 3,544 Mt-C in 2002 to 3,729 Mt-C in 2003, or 2.2% per annum from 2,923 Mt-C in 1992. As a result, CO₂ emissions per total primary energy supply, per real GDP and per population became 0.75 t-C/toe, 181.1 t-C/US Million-dollar (at 1995 price) and 1.57 t-C/capita in 2003 respectively.

Note: ton=Metric ton.

bbl=Barrel.

kL=killoliter.

CF=Cubic feet.

CM=Cubic meter.

GWh=Giga watt hour.

Gross Generation is the sum of the electrical energy production by all the generating sets (including pumped storage). Consumption for Electricity exclude Own Use and Loss.

		46,829	24,226	22,603	-	-	1,951

Note: ton=Metric ton.

bbl=Barrel.

kL=killoliter.

CF=Cubic feet.

CM=Cubic meter.

GWh=Giga watt hour.

Gross Generation is the sum of the electrical energy production by all the generating sets (including pumped storage).

Consumption for Electricity exclude Own Use and Loss.

3.5 China

Energy Balance Table of China in 2003

	1 Coal	2 Coal Products	3 Crude Oil	4 Petroleum Products	4.1 Mogas	4.2 Naphtha	4.3 Jet Fuel	4.4 Kerosene	4.5 Diesel Oil
1 Indigenous Production	791,841	-	161,123	-	-	-	-	-	-

TOTAL					235,536.16	TJ
NON-ENERGY						
TOTAL NON-ENERGY USE						TJ

Note:

CA estimates the final energy consumption of petroleum products for each sector. According to the definition of APEC Energy Statistics.

CA moved the data of Jet Fuel from International Marine Bunkers to Transport Sector.

The Physical Quantity of LPG for Stocks Change estimated by CA.

		885,142	500,899	95,188	285,866	3,189	-	-	-

Note: ton=Metric ton.

bbl=Barrel.

kL=killoliter.

CF=Cubic feet.

CM=Cubic meter.

GWh=Giga watt hour.

Gross Generation is the sum of the electrical energy production by all the generating sets (including pumped storage). Consumption for Electricity exclude Own Use and Loss.

3.9 Republic of Korea

		342,148	205,578	5,860	130,715	-	-

Note: ton=Metric ton.

bbl=Barrel.

kL=killoliter.

CF=Cubic feet.

CM=Cubic meter.

GWh=Giga watt hour.

Gross Generation is the sum of the electrical energy production by all the generating sets (including pumped storage). Consumption for Electricity exclude Own Use and Loss.

3.10 Malaysia

Note: ton=Metric ton.

bbl=Barrel.

kL=killoliter.

CF=Cubic feet.

CM=Cubic meter.

GWh=Giga watt hour.

Gross Generation is the sum of the electrical energy production by all the generating sets (including pumped storage). Consumption for Electricity exclude Own Use and Loss.

Note: ton=Metric ton.

bbl=Barrel.

kL=killoliter.

CF=Cubic feet.

CM=Cubic meter.

GWh=Giga watt hour.

Gross Generation is the sum of the electrical energy production by all the generating sets (including pumped storage). Consumption for Electricity exclude Own Use and Loss.

Notes:

- a Using average gross and net calorific values.
- 1. Crude oil and NGL/Condensate production include naphtha production.
- 2. Naphtha includes naphtha and feedstocks.
- 3. Other power/Others includes electricity generation from biogas, industrial waste and wood. Wood supply and demand are estimated.
- 4. Calendar year figures for energy consumption presented are actual data except for gas, electricity, biogas, industrial waste and wood.
 - coal consumption excludes coal used for cogeneration by industrial sector - definition changes since this new format 1999.
 - gas consumption excludes gas used for cogeneration by industrial and commercial sectors - definition changes since this new format 1999.
 - electricity consumption excludes electricity generated and consumed by cogeneration plants.
- 5. Final Energy Consumption excludes international marine bunkers.
- 6. Transport sector excludes international marine bunkers. Jet fuel includes international air transport.
- 7. Calendar year data for electricity generation includes estimates of the generation (except for years ending March) for Electricity Corporation of New Zealand Limited, Genesis Power Limited, Meridian Energy Limited, Mighty River Power Limited, Contact Energy, Electricity Companies and The Cogeneration Association of New Zealand.
- 8. Assuming efficiency of 10% for geothermal as discussed at the Workshop on Energy Statistics in APEC Region, 8th & 9th July 2002 in Tokyo.
- 9. Diesel oil includes automotive gas oil, marine diesel, blended heating oil, light fuel oil and light bunker fuel oil.
- 10. Fuel oil includes heavy fuel oil and heavy bunker fuel oil.

Note: ton=Metric ton.

bbl=Barrel.

kL=killoliter.

CF=Cubic feet.

CM=Cubic meter.

GWh=Giga watt hour.

Gross Generation is the sum of the electrical energy production by all the generating sets (including pumped storage). Consumption for Electricity exclude Own Use and Loss.

							253

Note: ton=Metric ton.

bbl=Barrel.

kL=killoliter.

CF=Cubic feet.

CM=Cubic meter.

GWh=Giga watt hour.

Gross Generation is the sum of the electrical energy production by all the generating sets (including pumped storage).

Consumption for Electricity exclude Own Use and Loss.

							22,898

Note: ton=Metric ton.

bbl=Barrel.

kL=killoliter.

CF=Cubic feet.

CM=Cubic meter.

GWh=Giga watt hour.

Gross Generation is the sum of the electrical energy production by all the generating sets (including pumped storage).

Consumption for Electricity exclude Own Use and Loss.

The APEC Reporting Format for Quarterly Energy Data

Member Name:

Coal

Unit: 1,000ton

	Production	Imports	Exports	Consumption (Sales)		
				Total	Electricity	Others
2002	JAN.					
	FEB.					
	MAR.					
	1st quarter					

Oil

Unit: 1,000bbl or 1,000kL

	Crude Oil				Production Total	Petroleum Products				
	Production	Imports	Exports	Throughput		Consumption (Sales)				
						Total	MOGAS	Diesel Oil	Others	
2002	JAN.									
	FEB.									
	MAR.									
	1st quarter									

Natural Gas (or LNG)

Unit: 1,000CF or 1,000CM (or 1,000ton for LNG)

	Production	Imports	Exports	Consumption (Sales)		
				Total	Electricity	Others
2002	JAN.					
	FEB.					
	MAR.					
	1st quarter					

Electricity

Unit: GWh

	Gross Generation					Imports	Exports	Consumption (Sales)
	Total	Thermal	Hydro	Nuclear	Others			
2002	JAN.							
	FEB.							
	MAR.							
	1st quarter							

Note: ton=Metric ton.

bbl=Barrel.

kL=killoliter.

CF=Cubic feet.

CM=Cubic meter.

GWh=Giga watt hour.

Gross Generation is the sum of the electrical energy production by all the generating sets (including pumped storage).

Consumption for Electricity exclude Own Use and Loss.

Definition of the APEC Energy Data Reporting Format (Table 1)

A. General note

The format includes all "commercial" sources of energy, both primary and secondary. Data for non-commercial energy and capacities of electricity, oil refining should be given in a separate table. This table is divided into three main parts; the first shows supply element; the second gives the transformation; the third shows final consumption broken down into the various end-use sectors.

B. Sectors

1. Indigenous production

Quantities of fuels extracted within the economy.

2. Opening stocks

Stock level at the beginning of the year.

3. Closing stocks

Stock level at the end of the year.

4. Stock change

Defined as the opening stocks minus the closing stocks. A decrease in stocks, shown in the table as a positive number, is added to supply and an increase in stocks, shown as a negative number, is deducted from supply.

5. Imports

Quantities of energy entering the territory usually excluding energy in transit.

6. Exports

Quantities of energy sold by a economy outside its borders.

7. Bunkers

Also known as international marine bunkers; quantities of fuel supplied to sea-going ships whatever their flags and category.

8. Total primary energy supply

Defined as indigenous production plus imports minus exports minus bunkers plus or minus stock change.

9. Transformation sector (input)

All the primary energy and some secondary energy (coal products) amounts to be input or consumed into transformation sectors such as refineries, power plants and gas plants, in order to generate the secondary energy.

(i) Coal Transformation

Consumption amounts of hard coals such as coking coal, steam coal, subbituminous coal and lignite for production of coke, coke oven gas, blast furnace gas and briquettes.

(ii) Refining

Consumption amounts of crude oil, NGL and condensate for production of petroleum products, such as naphtha, Mogas, jet fuel, kerosene, diesel oil, fuel oil, LPG and so on. Consumption amounts of natural gas for production of synthetic petrol is also included.

(iii) Gas processing

Consumption amounts of coal such as coking coal, steam coal, coal products such as coke and coke oven gas, petroleum products such as LPG, naphtha, refinery gas, and natural gas.

(iv) Power generation (public utilities)

Consumption amounts in thermal power plants:

- Coal, Coal products (coke oven gas and blast furnace gas)
- Crude oil, Petroleum products (fuel oil, LPG and naphtha, etc.)
- Natural gas

Generated amounts of electricity and their efficiency in hydro plants, nuclear plants, geothermal plants, wind power plants, tide power plants and photovoltaic power plants.

Consumption amounts of other fuel sources such as waste for electricity in other power plants.

(v) Power generation (private, auto producers)

Consumption amounts in thermal power plants:

- Coal, Coal products (coke oven gas and blast furnace gas)
- Crude oil, Petroleum products (fuel oil, LPG and naphtha, etc.)
- Natural gas

Generated amounts of electricity and their efficiency in hydro plants, nuclear plants, geothermal plants, wind power plants, tide power plants and photovoltaic power plants.

Consumption amounts of other fuel sources such as waste for electricity in other power plants.

10. Transformation sector (output)

The secondary energy amounts to be generated from the transformation sector.

(i) Coal transformation

Production amounts of coke, coke oven gas, briquettes and other coal products.

(ii) Gas recovering

Production amounts of blast furnace gas.

(iii) Refining

Production amounts of petroleum products such as naphtha, Mogas, jet fuel, kerosene, diesel oil, fuel oil, LPG, refinery gas and others. Synthetic petrol from natural gas is also included.

(iv) Gas processing

Production amounts of town gas, coke and LNG.

(v) Power generation (public utilities)

Generation amounts of electricity derived from thermal plants, hydro plants, nuclear plants, geothermal plants and other. The thermal plants are also divided into coal, oil and gas.

(vi) Power generation (private, auto producers)

Generation amounts of electricity derived from thermal plants, hydro plants, nuclear plants, geothermal plants and other. The thermal plants are also divided into coal, oil and gas.

11. Transformation sector (losses and own use)

This category comprises both losses and own use. Losses include all losses due to transport and distribution, including those from pipelines. Own uses include all own use for coal transformation plants, refinery plants, power plants (include gross electricity consumed for pumped storage), gas works plants and also include energy used

for coal mines, oil and gas extraction.

12. Final energy consumption total

Defined as agriculture plus residential commercial plus industry plus transport plus non-energy.

13. Agriculture

Energy use in performing agricultural, hunting, forestry and fishing operations.

14. Residential Commercial

(i) Residential

All consumption by households

(ii) Commercial

Consumption of the commercial and public sectors specified in the sub-sectors:

- Wholesale and retail trade
- Hotels and restaurants
- Financial intermediation
- Real estate, renting and business activities
- Public administration and defense, compulsory social security
- Education
- Health and social work
- Other community, social and personal service activities
- Extra-territorial organization and bodies
- Post and telecommunications

15. Industry

Consumption of the industry sector is specified in the following sub-sectors (energy use for transport by industry is not included here but reported under transport):

- Iron and steel industry
- Chemical industry
- Non-ferrous metals basic industries
- Non-metallic mineral products such as glass, ceramic, cement, etc.
- Transport equipment
- Machinery. Fabricated metal products, machinery and equipment other than transport equipment
- Mining (excluding fuels) and quarrying
- Food processing, beverages and tobacco
- Pulp, paper and printing

- Wood and wood products (other than pulp and paper)
- Construction
- Textiles and leather
- Collection, Purification and Distribution of water
- Non-specified (any manufacturing industry not included above)

16. Transport

Consumption of the Transport sector covers all transport activity regardless of the economic sector to which it is contributing, and is divided into the following sub-sectors:

- Air transport (international and domestic)
- Road transport
- Railways

17. Non-energy

Non-energy use covers use of other petroleum products such as white spirit, paraffin waxes, lubricants, bitumen and other products (tar, sulphur, and grease). It also covers other coal products (coal tar and creosote oil). They are shown separately by final consumption sector under the heading non-energy use and are included on total final consumption. It is assumed that the use of these products is exclusively non-energy use. It should be noted that petroleum coke is shown as non-energy use only when there is evidence of such use, otherwise it is shown under energy use in industry or other sectors. Feedstocks for the petrochemical industry are accounted for in industry (paragraph 15). This covers all oil including naphtha, except the other petroleum products listed above, and gas used as petrochemical feedstocks. Gas used as raw material for chemical products such as methanol and ammonia/urea is also included.

C. Sources

1. Coal

Defined as hard coal plus anthracite plus lignite.

(i) Hard coal

Defined as steam coal plus coking coal plus subbituminous coal.

a. Steam coal

Steam coal is coal used for steam raising and space

heating purposes and includes Bituminous coals not included Coking coal. Its gross calorific value is greater than 23,865 kJ/kg (5,700 kcal/kg), but usually lower than that of coking coal.

b. Coking coal

Coking coal refers to coal with a quality that allows the production of a coke suitable to support a blast furnace charge. Its gross calorific value is greater than 23,865 kJ/kg (5,700 kcal/kg) on an ash-free but moist basis.

c. Subbituminous coal

Non-agglomerating coals with a gross calorific value of between 17,435 kJ/kg (4,165 kcal/kg) and 23,860 kJ/kg (5,700 kcal/kg) containing more than 31 percent volatile matter on a dry mineral matter free basis.

(ii) Anthracite

Same as steam coal above mentioned.

(iii) Lignite (Brown coal)

Lignite is a non-agglomerating coal with a gross calorific value of less than 17,435 kJ/kg (4,165 kcal/kg), and greater than 31 percent volatile matter on a dry mineral matter free basis.

2. Coal products

Defined as coke plus briquettes plus coke oven gas plus blast furnace gas plus other coal products.

(i) Coke

This category comprises both "coke oven coke" and "gas coke". Coke oven coke is the solid product obtained from the carbonization of coal, principally coking coal, at high temperature. Gas coke is a by-product of hard coal used for the production of town gas in gas works. Gas coke is used for heating purposes.

(ii) Briquettes

Briquettes are composition fuels manufactured from brown coal, produced by briquetting under high pressure. These figures include peat briquettes, dried brown coal, fines and dust and brown coal breeze.

(iii) Coke oven gas

Coke oven gas is obtained as a by-product of the manufacture of coke oven coke for the production of iron and steel.

(iv) Blast furnace gas

Blast furnace gas is produced during the combustion of coke burnt in furnaces in the iron and steel industry. It

is recovered and used as a fuel for various purposes, among others in power plants.

(v) Other Coal Products

Other coal products comprise coal tar, creosote oil and others that are by-product of coal used for coal transformation process.

3. Crude oil and NGL/Condensate

(i) Crude oil

Crude oil is a mineral oil consisting of a mixture of hydrocarbons of natural origin, yellow to black in color, of variable density and viscosity.

(ii) NGL/Condensate

NGL is liquid or liquefied hydrocarbons produced in the manufacture, purification and stabilization of natural gas. This is those portions of natural gas which are recovered as liquids in separators, field facilities, or gas processing plants. NGL includes ethane, propane, butane, pentane, natural gasoline and condensates. It may also include quantities of non-hydrocarbons.

This item also includes lease condensate (separator liquids), which is recovered from gaseous hydrocarbons in lease separation facilities.

4. Petroleum products

Total of all petroleum products, such as LPG, naphtha, MOGAS, AVGAS, jet fuel, kerosene, diesel oil, fuel oil, refinery gas and other petroleum products.

(i) LPG

This is the light hydrocarbon fraction of the paraffin series, derived from refinery processes and from crude oil stabilization plants comprising propane (C_3H_8) and butane (C_4H_{10}) or a mixture of these two hydrocarbons.

(ii) Naphtha

Naphtha includes light or medium oils, a cut covering the end of the motor spirit and the beginning of the kerosene range. Naphtha distills between 30 °C and 210 °C.

(iii) MOGAS

This is light hydrocarbon oil for use in internal engines such as motor vehicles, excluding aircraft. Motor gasoline is distilled between 35 °C and 215 °C and treated by reforming, catalytic cracking or blending with aromatic fraction to reach a sufficiently high octane number (≥ 80 RON).

(iv) AVGAS

AVGAS (aviation gasoline) is motor spirit prepared especially for aviation piston engines, with an octane number suited to the engine, a freezing point of –60 °C, and a distillation range usually within the limits of 30 °C and 180 °C.

(v) Jet fuel

This category comprises both gasoline and kerosene type jet fuels meeting specifications for use in aviation turbine power units.

Gasoline type: This includes all light hydrocarbon oils, distilling between 100 °C and 250 °C. It distills at least 20 percent in volume at 143 °C.

Kerosene type: This medium oil with same distillation characteristics and flash point as kerosene, with a maximum aromatic content of 22 percent in volume, and treated to give a kinematic viscosity of less than 18 cST at -20 °C (and a freezing point below -47 °C), octane number varying from 80 to 145 RON.

(vi) Kerosene

Kerosene comprises refined petroleum distillate intermediate in volatility between gasoline and gas/diesel oil. It is a medium oil distilling between 150 °C and 300 °C, which distills at least 65 percent in volume at 250 °C. Its specific gravity is in the region of 0.80 and the flash point is above 38 °C.

(vii) Diesel oil

Diesel oil includes heavy gas oils. Gas oils are obtained from the lowest fraction from atmospheric distillation of crude oil, while heavy gas oils obtained by vacuum redistillation of the residual from atmospheric distillation.

(viii) Fuel oil

Fuel oil defines oils that make up the distillation residue. It comprises all residual fuel oils (including those obtained by blending). Its kinematic viscosity is above 10 cSt at 80 °C. The flash point is always above 50 °C. and the density is always more than 0.90.

(ix) Refinery gas

Refinery gas is defined as non-condensable gas obtained during distillation of crude oil or treatment of oil products (e.g. cracking) in refineries. It consists mainly of hydrogen, methane, ethane, and olefins.

(x) Other petroleum products

The category, "Other petroleum products", groups together white spirit and SBP, lubricants, bitumen, paraffin waxes and others (tar, sulfur, grease).

5. Gas

Defined as natural gas and LNG plus town gas.

(i) Natural gas and LNG

a. Natural gas

Natural gas consists mainly of methane occurring naturally in underground deposits associated with crude oil or gas recovered from coal mines (colliery gas). Sewage gas is also included.

b. LNG

LNG is liquefied natural gas.

(ii) Town gas

Town gas covers all types of gas produced in public utility or private plants, whose main purpose is production, transport and distribution of gas. It includes gas produced by carbonisation (including gas produced by coke ovens at gas works), by total gasification with or without enrichment with oil products, by cracking of natural gas, and by reforming and simple mixing of gases and/or air. Town gas also includes substitute natural gas, which is a high calorific value gas manufactured by chemical conversion of a hydrocarbon fossil fuel.

6. Hydro power

Power generation from hydro plants, including pumped up plants.

7. Nuclear power

Power generation from nuclear plants.

8. Geothermal power

Power generation from geothermal plants.

9. Wind

Power generation from wind energy.

10. Tide

Power generation from tide, wave and ocean energy.

11. Photovoltaic power

Power generation from solar energy.

12. Other power

Power generation from other fuel sources such as defined in "Others" energy.

13. Geothermal heat

Heat obtained from geothermal energy.

14. Solar heat

Heat obtained from solar energy.

15. Others

Comprises commercial materials used as fuels directly and materials used for power generation such as peat, wood and wood waste, vegetal, municipal and industrial waste, landfill and sludge gas, and sulphite lies ("black liquor") as residual from the paper industry.

16. Electricity

Shows net electricity production which is defined as gross production less own use of power plants which appears in the "losses and own use" sector. Net electricity production is measured at the station busbars, after deduction of electricity consumed within the station. Fuel consumption in thermal power plants are split into public utilities and autoproducers.

17. Heat

Heat obtained from the combined heat and power plants (CHP) and from autoproducer's heat that is sold to a third party (e.g. to a network).

D. Conversion Factors

Net calorific value must be applied for conversion from physical quantities to thermal quantities as following "IEA Energy Statistics".

Definition of the APEC Energy Data Reporting Format (Table 2)

A. General note

The format shows all "commercial" energy consumption in the specified sectors.

B. Sectors

1. Industry Sector

The industry sector comprises following six sectors:

- 1.1 Iron and Steel [ISIC Group 271 and Class 2731];
- 1.2 Chemical and Petrochemical [ISIC Division 24];
- 1.3 Non-ferrous Metals [ISIC Group 272 and Class 2732];
- 1.4 Non-metallic Mineral Products [ISIC Divisions 26];
- 1.5 Paper, Pulp and Printing [ISIC Divisions 21 and 22];
- 1.6 Other Industries (industry not included above)

2. Transport Sector

Energy consumption in the Transport sector covers all transport activity (in mobile engines) regardless of the economic sector to which it is contributing [ISIC Divisions 60, 61 and 62], and is divided into the following sub-sectors:

- 2.1 Air: Deliveries of aviation fuels to international civil aviation and all domestic air transport.
- 2.2 Road: All fuels used in road vehicles as well as agricultural and industrial highway use. Excludes motor gasoline used in stationary engines, and diesel oil for use in tractors that are not for highway use.
- 2.3 Rail: All quantities used in rail traffic, including industrial railways.
- 2.4 Internal navigation (including small craft and coastal vessels not purchasing their bunker requirements under international marine bunker contracts). Fuel used for ocean, coastal and inland fishing should be included in agriculture.

3. Residential and Commercial Sector

- 3.1 Commercial and Public Service: All activities coming into ISIC Divisions 41, 50, 51, 52, 55, 63, 64, 65, 66, 67, 70, 71, 72, 73, 74, 75, 80, 85, 90, 91, 92, 93 and 99.

3.2 Residential: All consumption by households excluding fuels used for transport. Includes households with employed persons [ISIC Divisions 95].

C. Sources

Refer to the Definition of Revised APEC Energy Data Reporting Format (Table 1)

Definition of the APEC Energy Data Reporting Format (Table 3)

A. General note

The format includes three types of annual energy prices. They are:

- Import CIF Prices
- Wholesale Prices
- Consumer Prices

The format accepts not only real prices but also indices.

B. Sectors

1. Import CIF Prices

These prices are obtained by dividing value by volume in foreign trade. Value and volume are recorded by customs administrations for each tariff position. Values recorded at the import stage include cost, insurance and freight (CIF) but exclude import duties.

2. Wholesale Prices

Energy prices to be purchased by industry are reported.

3. Consumer Prices

Energy prices to be purchased by households are reported.

C. Sources

Following energies are objective to collection of price data;

- Coal
- Crude Oil
- Petroleum Products
- Natural Gas
- Town Gas
- Electricity

Definition of Columns and Rows of the Energy Balance Table

A. Unit

For the purpose of presenting its energy balances the APEC has adopted kcal and Joule. 10^7 kilo calories (41.868 giga joules) is defined as one ton of oil equivalent. This quantity of energy is, within a few percent, equal to the net heat content of 1 ton of crude oil.

B. Conversion (from original to TOE)

The Coordinating Agency has adopted specific factors supplied by the member economies for each flow or use. The balances are expressed in term of "net" heat value. The difference between the "net" and "gross" heat value for each fuel is the latent heat in condensation of the water vapor produced during combustion of the fuel. For coal and oil, net heat value is 5 percent less than gross, for most forms of natural and manufactured gas the difference is 9-10 percent, while for electricity there is no difference. The use of net heat value is consistent with the practice of the Statistical Offices of the European Communities and the United Nations.

C. Layout

The energy balances are presented in tabular format: columns for the various sources of energy and rows for the different origins and uses.

(1) Columns

Across the top of the table from left to right, there are thirteen columns with the following headings:

Column 1:

Coal includes all primary coal, such as hard coal, lignite and brown coal.

Column 2:

Coal Products includes all fuels derived from coal including patent fuel, coke oven coke, gas coke, briquettes, coke oven gas and blast furnace gas.

Column 3:

Crude Oil comprises crude oil, refinery feedstocks and natural gas liquids. Natural LPG is included in

Column 4:

Petroleum products comprises LPG, refinery gas, aviation gasoline, motor gasoline, jet fuels, kerosene, gas/diesel oil, residual fuel, naphtha, white spirit, lubricants, bitumen, paraffin waxes, petroleum coke and other petroleum products.

Column 4.1:

Mogas is light hydrocarbon oil for use in internal engines such as motor vehicles, excluding aircraft. Motor gasoline is distilled between 35 °C and 215 °C and treated by reforming, catalytic cracking or blending with aromatic fraction to reach a sufficiently high octane number (≥ 80 RON).

Column 4.2:

Naphtha includes light or medium oils, a cut covering the end of the motor spirit and the beginning of the kerosene range. Naphtha distills between 30 °C and 210 °C.

Column 4.3:

Jet fuel comprises both gasoline and kerosene type jet fuels meeting specifications for use in aviation turbine power units.

Gasoline type: This includes all light hydrocarbon oils, distilling between 100 °C and 250 °C. It distills at least 20 percent in volume at 143 °C.

Kerosene type: This medium oil with same distillation characteristics and flash point as kerosene, with a maximum aromatic content of 22 percent in volume, and treated to give a kinematic viscosity of less than 18cST at -20 °C (and a freezing point below -47 °C), octane number varying from 80 to 145 RON.

Column 4.4:

Kerosene comprises refined petroleum distillate intermediate in volatility between gasoline and gas/diesel oil. It is a medium oil distilling between 150 °C and 300 °C, which distills at least 65 percent in volume at 250 °C. Its specific gravity is in the region of 0.80 and the flash

point is above 38 °C.

Column 4.5:

Diesel oil includes heavy gas oils. Gas oils are obtained from the lowest fraction from atmospheric distillation of crude oil, while heavy gas oils obtained by vacuum redistillation of the residual from atmospheric distillation.

Column 4.6:

Fuel oil defines oils that make up the distillation residue. It comprises all residual fuel oils (including those obtained by blending). Its kinematic viscosity is above 10 cSt at 80 °C. The flash point is always above 50 °C. and the density is always more than 0.90.

Column 4.7:

LPG is the light hydrocarbon fraction of the paraffin series, derived from refinery processes and from crude oil stabilization plants comprising propane (C_3H_8) and butane (C_4H_{10}) or a mixture of these two hydrocarbons

Column 4.8:

Refinery gas is defined as non-condensable gas obtained during distillation of rude oil or treatment of oil products (e.g. cracking) in refineries. It consists mainly of hydrogen, methane, ethane, and olefins.

Column 4.9:

The category, "Other petroleum products", groups together white spirit and SBP, lubricants, bitumen, paraffin waxes and others (tar, sulfur, grease).

Column 5:

Gas includes natural gas (excluding natural gas liquids).

Column 5.1:

Natural gas consists mainly of methane occurring naturally in underground deposits associated with crude oil or gas recovered from coal mines (colliery gas). Sewage gas is also included.

Column 5.2:

LNG is liquefied natural gas.

Column 6:

Town Gas includes gas processing gas and gas works gas.

Column 7:

Hydro shows the energy content of the electricity

produced in hydro power plants. Hydro output includes output from pumped storage plants.

Column 8:

Nuclear shows the primary heat equivalent of the electricity produced by a nuclear power plant with an average thermal efficiency of 33 percent.

Column 9:

Geothermal, solar, etc shows the primary heat equivalent of the electricity produced in geothermal plants with an average thermal efficiency of 10 percent, and the energy content of electricity produced in non-thermal power plants such as photovoltaic, wind, tide wave etc.

Column 9.1:

Power generation from geothermal plants.

Column 9.2:

Power generation from wind tide, wave and ocean energy.

Column 9.3:

Heat obtained from geothermal energy.

Column 9.4:

Heat obtained from solar energy.

Column 10:

Others includes wood, wood waste, black liquor, industrial and municipal waste and biomass (power generation from other fuel sources such as defined in "Others" energy. is included here). But non-commercial ones are excluded.

Column 11:

Electricity shows final consumption and trade in electricity (which is accounted at the same heat value as electricity in final consumption; i.e. 1 GWh = 0.000086 MTOE).

Column 12:

Heat includes heat production from public Combined Heat Power plants (CHP), from autoproducer's heat that is sold to a third party (e.g. to a network).

Column 13:

TOTAL = the total of columns (1) to (12).

(2) Rows

The categories on the left hand side of the table have the following functions.

Row 1:

Indigenous production shows only production of primary energy, i.e. hard coal, lignite, crude oil, NGL's and natural LPG, natural gas, hydro and nuclear, geothermal etc. electricity and others.

Row 2/3:

Imports and exports comprise amounts having crossed the boundaries of the economy whether or not customs clearance has taken place.

Row 4:

International marine bunkers cover those quantities delivered to sea-going ships of all flags. Consumption by ships and planes engaged in transport in inland and coastal waters is not included.

Row 5:

Stock changes are treated as follows: a decrease in stocks, shown in the table as a positive number, is added to supply and an increase in stocks, shown as a negative number, is deducted from supply. Producers', importers', energy transformation industries' and large users' stocks are included.

Row 6:

Total primary energy supply (TPES) are made up of indigenous production (Row1) + imports (Row2) - exports (Row3) - international marine bunkers (Row4) and ± stock changes (Row5).

Row 7:

Public electricity, column 1 to 10 show primary and secondary fuel input to public utilities' plants as negative entries. Gross electricity produced (including power stations' own consumption) appears as a positive quantity in column 11, "Electricity". Transformation losses appear in the "Total", column 13, as a negative number.

Row 8:

Auto-producers of electricity, columns 1 to 10 show primary and secondary fuel input to electricity generation of auto-producers as negative entries. An auto-producer is an establishment which, in addition to its main activities, generates electricity wholly or partially for its own use, such as industries, railways, refineries etc. Total gross electricity produced appears as a positive quantity in column 12, "Electricity". Transformation losses appear in the "Total", column 13 as a negative number.

Row 9:

Where there is a production of gas at Gas Processing the treatment is similar to that for electricity generation, with the quantity produced appearing as a positive figure in column 6 "Town Gas", input as negative entries in column 1 (coal), 2 (coal products), 4 (petroleum products) and 5 (natural gas input) and conversion losses appearing in the "Total" column.

Row 10:

The row Petroleum refineries shows the transformation of crude oil, NGL and condensate to petroleum products. The production of synthetic petrol from natural gas is also included.

Row 11:

Coal transformation shows the transformation of coal from primary to secondary fuels and from secondary to tertiary fuels (hard coal to coke, coke to blast furnace gas, brown coal to BKB, etc).

Row 12:

Own use & loss: Own use contains the primary and secondary energy consumed by transformation industries for heating, traction and lighting purposes. These are shown as negative figures. Included here are, for example, the coal mines' own use of energy, energy use in refineries, electricity plants' own consumption (which includes gross electricity consumed for pumped storage), and energy used for oil and gas extraction (which also includes consumption for the pipeline system). Loss include losses in gas distribution, electricity transmission, and coal transport.

Row 13:

Discrepancy is a category which includes the sum of the unexplained statistical differences for individual fuels.

Row 14:

Total Final Consumption (TFC) is the sum of consumption by the different end-use sectors. In final consumption, petrochemical feedstocks as well as natural gas for producing fertilizer are shown under industry sector.

Row 15:

Consumption of the Industry sector (energy used for transport by industry is not included here but reported under transport).

Row 16:

The Transport sector includes all fuels for transport, except international marine bunkers. It includes transport in the industry sector and covers road, railway, internal and international air, internal navigation (including small craft, fishing vessels and coastal shipping not included under marine bunkers) and non-specified transport.

Row 17:

Other sectors cover agriculture, residential, commercial and public services and non-specified consumption.

Row 18:

Consumption of the Agriculture sector.

Row 19:

Consumption of the Residential and Commercial sectors. Public services also is included here.

Row 20:

Other shows non-specified use which may include military use.

Row 21:

Non-energy use covers use of other petroleum products such as white spirit, paraffin waxes, lubricants, bitumen and other products. Petroleum coke is shown as

non-energy use only when there is evidence of such use, otherwise it is shown under energy use in industry or other sectors. Feedstocks for the petrochemical industry are accounted for in industry (row 15). This covers all oil including naphtha, except the other petroleum products listed above, and gas used as petrochemical feedstock. Gas used as raw material for chemical products such as methanol and ammonia/urea is also included.

Conversion Factors

A. Gas

To convert the gross heat content of a gas to its net heat content, the following multiplying factors may be used.

Natural gas	0.9
Gas processing gas	0.9
Coke oven gas	0.9
Blast furnace gas	1.0

B. Electricity

Figures for electricity production, trade, and final consumption are calculated using the energy content of the electricity, i.e. at a rate of 1 TWh = 0.086 MTOE. Hydro-electricity production (excluding pumped storage) and electricity produced by other non-thermal means, (wind, tide, photovoltaic etc) are accounted for similarly using 1 TWh = 0.086 MTOE. However, the primary energy value ascribed to nuclear power plants is calculated from the gross generation by assuming that only 33% of the primary energy content appears as electricity, i.e. 1 TWh = (0.086/0.33) MTOE. In the case of electricity produced from geothermal heat the primary value is calculated using 1 TWh = (0.086/0.1) MTOE.

C. Crude Oil

The conversion factors of each economy are applied.

D. Petroleum Products

The conversion factors of each economy are applied.

E. Coal

Coal has separate factors for production, imports, exports, inputs to power plants, coal used in coke ovens, and coal used in industry. Each economy's individual conversion factors are applied.

F. Others

The following conversion factor is used for other energy, such as wood, wood waste, black liquor etc.

1 TJ (net) = 0.00002388 MTOE

G. Heat

Information on heat is supplied in net tera joules. 1 TJ = 0.00002388 MTOE.
